

Exploring the Power, Opportunities, & Trends of Automated Solutions to Keep Up With Demand

Ron Ellis, Product Manager, Lectra

Advanced Textiles

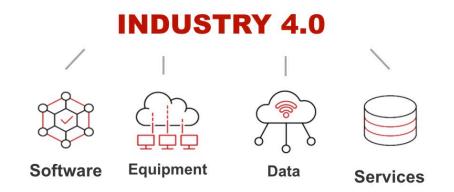

What is "Integrated Automated Manufacturing"?

- Smart Machines: Connected machines that can output and receive data related to production and machine health
- CLOUD Services that enable on-the fly decision
- Remote reporting and support
- BIG DATA analytics and Artificial intelligence
- Enables CSR initiatives by tracking power consumption, optimizing operational cycles

Advanced Textiles

"IOT" Internet of THINGS

- An eco-system of devices and physical objects that can exchange data over a network without any need for human intervention
- IOT solutions can analyze data and relay information about equipment for predictive maintenance, helping to minimize machine downtime, errors and waste.

Advanced Textiles

Cloud computing

- Cloud technology is no longer just about on-demand data storage and computing, but also providing enough accessibility to facilitate sharing and teamwork while ensuring data privacy and security.
- Immediate updates to software, enhancements and services, without needing local "desktop" applications to be scheduled for local updates. You are always on the latest version
- Software as a Service (SaaS) enable pay a you go affordability.

Advanced Textiles

Big data analytics

 Having to handle large volumes of data coming from all parts of the supply chain is a huge challenge. Modern cloud based solutions help to consolidate, analyze and clean business insights from this data.

Artificial intelligence (A.I.)

- Al engines compare data to establish "norms", make recommendations, customize and optimize systems. Al can calculate and compare millions of data points in seconds (think self-driving cars and unpiloted drones)
- Machines now have the ability to copy, automate and optimize processes while being personalized to the needs of the user based on AI inputs/outputs

Summary

Integrated Automation enables factories to

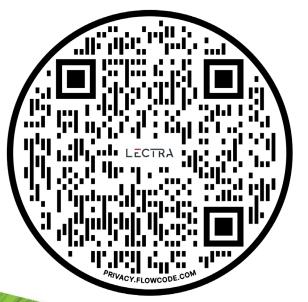

- Optimize production cycles (do more with less)
- Reduce or eliminate human errors
- Automate non-value processes
- Enable and even automate on-the-fly decisions
- Provide insight to production information, track orders, provide machine health REMOTELY
